

EXAMPLES AND COMPLETE CASE STUDIES

This part contains modeling examples for simple and more complex objects. They are presented as a complete or partial study or even a comparison of different models of the same structure.

If you happen to have an example that you wish to share with us of a complexity or paradox noticed on a part of a model, please send it to the following address: elements.finis@afgc.fr. (It could be a note about a real project rendered anonymously.)

Example A - Modelling a complex high-rise building

Example A - Modelling a complex high-rise building

Example B - Modelling of composite bridges

Example B - Modelling of composite and steel bridges

Example C - Modelling of beam grids

Example C - Modelling of beam grids

Example D - Simple example: modeling of a Br wheel

Example D - Modelling of a Br wheel

Example E - Transverse bending of a prestressed concrete box girder

Example E - Transverse bending of a prestressed concrete box girder

Example F - Dynamic calculations of tanks

Example F - Dynamic calculations of tanks

Example G - Cable-stayed bridges

Example G - Cable-stayed bridges
